Implement User Authentication in React #566

Open

PFA24SCM09R opened this issue 1 hour ago · 0 comments

PFA24SCM09R commented 1 hour ago

Collaborator

Implement a user authentication system within the React application to enhance security and manage user sessions effectively. The authentication system should include the following features:

- User Registration : - Allow new users to create an account with a secure password.
- Login Functionality: Enable users to log in with their credentials, storing their session securely.
- Password Encryption: Use strong encryption (e.g., bcrypt) to securely store user passwords.
- Session Management: Implement session handling, ensuring that user sessions persist securely and end upon logout.
- Two-Factor Authentication (Optional): For added security, provide an option for two-factor authentication using a service like Google Authenticator or SMS.
- Error Handling: Handle common authentication errors (e.g., incorrect password, user not found) with user-friendly feedback.
