Improve Error Handling for HTTP Requests in Angular Application #441

Edit   **New issue**

🟢 Open   AFA24SCM46D opened this issue 20 minutes ago · 0 comments

AFA24SCM46D commented 20 minutes ago   Collaborator ···

Description:
In the current Angular application, HTTP error handling could be more robust, especially when dealing with network failures or unauthorized access. This improvement aims to enhance the application's resilience by adding detailed error-handling methods and more user-friendly feedback when HTTP requests fail.

Proposed Solution:
Implement a global HTTP interceptor to handle errors across the application.
Standardize error messages for common errors like 404 (Not Found), 500 (Server Error), and 401 (Unauthorized).
Display user-friendly alerts or notifications to inform users about issues, enabling them to take corrective actions.
Acceptance Criteria:
Interceptor Implementation: A global HTTP interceptor is created to manage error responses centrally.
Error Messages: Custom error messages are shown based on HTTP status codes.
User Feedback: Informative alerts or notifications are displayed for errors, with options for users to retry actions or refresh data if needed.
Impact:
This enhancement will improve the user experience by providing consistent, clear, and actionable error messages, minimizing user confusion during connectivity or authorization issues.

Additional Notes:
This issue requires modification of the core HTTP handling logic and potential UI changes to incorporate error notifications.

😊
